

**METHOD AND APPARATUS FOR CONTROLLING UPLINK POWER
TO MAINTAIN DESIRED FRAME ERROR RATE IN A
WIRELESS COMMUNICATIONS SYSTEM**

5

Abstract of the Disclosure

In the absence of a continuous channel from the mobile terminal that incorporates a CRC in each transmitted frame from which the base station can derive a power control signal for feedback to the mobile station for maintaining 10 the mobile station's pilot E_b/N_0 level at a desired target that corresponds to a particular frame error rate, the pilot signal received by the base station from the mobile terminal itself is arranged in a frame format. Each pilot frame is compared with an *a priori* known transmitted pilot signal bit pattern to determine whether it has been received in error. In response to a comparison of a received 15 pilot frame with the expected known bit pattern of the pilot frame, an error signal is derived, which in the described embodiment is either a step-up or step-down signal that is fed back to the mobile terminal to increase or decrease its transmitted pilot E_b/N_0 level, respectively.
